S6 Changelog

Claim boundaries and neurocomputational integration

Article type: Supplementary Material

Short title: NDT changelog

Scope and intent

This changelog records substantive revisions to the NDT framework manuscript. It distinguishes changes in prose or architecture from new empirical evidence and preserves negative or bounded findings that constrain the theory.

Changelog

2026-08-07: Neurocomputational integration and claim-boundary revision

- Preserved Tier-1 scope as Minimal-MNDM, functional RVC, and MNPS. Simulator audits, subsystem theory, NDT-Q, EAP, and metabolic material are explicitly Tier-2 extensions or companion programmes.
- Added a truth-known simulator appendix section. Its recovery results are described as synthetic estimator audits; aggregate reachability calibration is retained while the failed directional Gate R claim is retained as a rejection. No simulator Jacobian is equated with empirical MNJ.
- Added subsystem sections for CCTG and HELS. CCTG is a speculative context-conditional transition-field account; HELS has validated infrastructure but no validated landscape-writing mechanism.
- Added NDT-Q content sections as an operational content/readout architecture. The revision explicitly rejects fibre-topology, quale-measurement, and mouse-phenomenology interpretations.
- Separated functional RVC from the proposed TRN–VG mechanism. Following Zenodo 21774408, the manuscript now records a bounded PV-linked MGB population-dimensionality result and states that full TRN–VG, single-unit variance gating, SOM equivalence, and TRN-to-$\sigma(t)$ identification are not validated.
- Recast the TRN conductance-to-variance relation as a simulation sensitivity ansatz with no empirically identified κ.
- Preserved EAP formal equations as Tier-2 targets while adding an empirical status bridge: wake task-phase co-modulation and carrier-specific RichSleep timing are constrained observational results, not causal entrainment.
- Added the paired hypoglycemia–euglycemia result as a metabolic perturbation boundary: stratified MNPS shifts are retained, while reachability collapse, metabolic EAP gating, and consciousness-level interpretation are not supported.
- Replaced the previous mis-copied S4 clinical-template placeholder with this actual changelog and added a status-marked glossary.
