S4 Supplementary Clinical Summary

A cautious clinician-facing interpretation of the article

Article type: Supplement

Short title: S4 Clinical Summary - [short article tag]

Robin Langell[1]

Scope and intent

Important: observational study - no intervention tested

This study tested **no** clinical intervention. Participants performed ordinary laboratory conditions; no physiology or brain state was manipulated directly. All reported findings are **observational, cross-sectional, and group-level**. No individual-level predictions are supported. No causal inference beyond the tested associations is warranted.

[Placeholder. State that this supplement is written for clinicians and clinically oriented readers, that the goal is translation not amplification, and list the framing limitations: healthy vs. clinical sample, correlational design, non-validated research metrics.]

What is the framework, and why does it matter here?

[Placeholder. Plain-language explanation of the theoretical framework and why a clinician should care.]

What was studied

[Placeholder. Dataset, sample, conditions, and recording modalities in plain language.]

What the coordinates mean in plain language

[Placeholder. Translate each coordinate / metric into a plain-language description.]

The main findings, in order of clinical salience

1. [Primary finding in plain language]

[Placeholder.]

2. [Confound / dissociation finding]

[Placeholder.]

3. [Secondary finding, if any]

[Placeholder.]

What was NOT found - equally important

[Placeholder. State the nulls and the non-significant trends explicitly.]

How to read the technical terminology clinically

[Placeholder. Map the key technical terms to clinically meaningful concepts, with caution about over-interpretation.]

What clinicians should not conclude

[Placeholder. List the inference errors a clinician should avoid (causal claims, individual-level prediction, diagnostic use).]

What would increase clinical confidence

[Placeholder. Replication in patient samples, longitudinal designs, validated biomarker testing, intervention studies.]

Summary for clinical readers

[Placeholder. One-paragraph balanced summary.]
