S5 Glossary

Estimator and inference boundaries

Article type: Supplement

Short title: Glossary ds004511

Terms

Subject anchored – Implemented: coordinates are expressed under the declared subject-level anchoring contract. Interpretation: within-subject task contrasts are meaningful under that contract. Not established: a common between-subject amplitude scale.

Chart-Jacobian alpha – Implemented: spectral abscissa of the local chart Jacobian. Interpretation: a local chart-flow summary. Not established: an identified one-step or biological generator.

One-step L2/L3 – Implemented: quantities of an identified lag-1 transition map, reported only where support is available. Interpretation: a model-conditional short-step summary. Not established: the chart Jacobian or an iterated L4 map.

Reachability amplitude – Implemented: a finite-horizon certificate-derived amplitude summary. Interpretation: conditional on certificate validity. Not established: occupancy, dimensional capacity, or causal accessibility.

BH family – The finite tests corrected together by Benjamini–Hochberg. This article keeps occupancy/MNJ/L1/L4 separate from the Jacobian-alpha/L2/L3 panel.

Partial support – The estimator is absent for some recordings because its stated identification/support condition was not met. It is not a zero and not automatically missing at random.
